

- **TEAM ROLES**

- **WILL** - Main Page, Login & Signup Page, About Us Page
- **Owen** - Add Album Page, My Collection Page, Confirmation Page

Splitting the roles up this way allows Will to focus more on the look and design of the main page, which shows all music albums available, while Owen works on more of the user interaction of the website, allowing the user to choose their favorite albums.

- **TECH STACK**

- **Together** - We plan on working on both front end and backend design and software together through communication, because we both want to have input into the design, and will work on our own webpages that will require both backend and frontend development.

- **KEY FEATURES**

- **User** - We will allow a user to sign in to our website to save their data, and create different album lists that they like based on the provided albums. Having a username and password to verify and save data is very beneficial for our project, and will save data for the user.
- **Saved Albums** - With having a user we have allowed the user to make the website to be designed around the music that they like, by allowing them to choose their favorite albums. We add these to a separate page that they can view later.

- **EXPECTED CHALLENGES**

- There will be plenty of challenges throughout the course of this project, and they usually come up as we go. However one of the biggest challenges for us will be the ability to communicate with each other despite not having any classes or time spent together outside of class. We usually do a good job with this, but it still is a challenge not being together very often.
- The Design might be the biggest challenge because of it being pretty opinionated. So agreeing on design choices will be a challenge, and then figuring out how to make it look better after we have a rough draft done as well.
- As far as code, its hard to say because we haven't had anything done yet, but we know problems will arise, because thats what happens in code.
